# How to Hack Instagram password with special application

Many of today's social media platforms are on target of various paid hackers who are hired on dark web to break inside someone's profile.

As Instagram is a leading social network of today in the world, many hackers decide to steal valuable accounts with thousands of followers so they can sell it for decent price.

Markets are usually placed on dark web too, and accounts are paid in crypto currencies so sellers can remain hidden.

Recently one very special application was sold there in over three thousands of copies before it got busted and thread deleted by forum staff team. (Someone reported it to authorities after just few hours of being posted.)

It's about **Instagram Hack** tool. As its name says, an user can find login password of desired person with registered IG profile. All they have to do is to enter someone's username inside the app, press a button, and app does all job by itself in just few minutes of running.

Authors of this "naughty" tool are *Extreme Programming* group, who also advertised about the app on their official [website](#).

Instagram security team representatives replied they didn't get any reports of exploits in their app nor found any vulnerability it can lead to hacking their platform.

This leaves us a question to ask is it their lie to protect Instagram name in social media market. Or those hackers are lie so they can sell unworking software and still earn money. Because they get paid in Bitcoin currency which can't be tracked to find sellers or buyers identity information.

In case this program works, we assume it uses a "bruteforce" method of cracking which attacks login page of Instagram with thousands combinations of all kind passwords in very short time until it guess right one. Read more about brute-forcing at [Wikipedia](#).

These are some screenshots of how these apps looks like:
